FINFRONT SDK / CASE STUDY

Trading interfaces. Built as one system.

A self-directed product and UX systems project.

CLAUDE + GOOGLE'S AI TOOLS · MONTHS OF WORK, DONE IN DAYS

RICK HOLLANDSWORTH · PRINCIPAL PRODUCT DESIGNER

SEPTEMBER 2026

One SDK. Five verticals. Seventy-five components.

A headless React 19 / TypeScript component system and design library for trading, wealth-management, and alternative-investment platforms. Order books, order tickets, portfolio and deal dashboards — composed, not rebuilt.

75

COMPONENTS

Documented in the design library — demo, code, props, behavior.

5

VERTICALS

FX / Prop · RIA · CRE & Alts · Commodities · Core.

3

DEVICE TARGETS

Desktop, mobile, and watch — designed separately.

Every platform rebuilds the same screens. Every tick feed breaks them the same way.

THE OLD WAY

01 12–18 months. $2M–$4M. One trading UI.

02 Order books, blotters, dashboards — rebuilt from scratch on every platform.

03 100+ ticks per second. React's default renderer stalls the main thread.

THE GAP

01 TradingView, DXtrade, cTrader — liquid markets only.

02 Cap rates, target IRR, GP/LP waterfalls — the language of private markets, undesigned.

03 An open category. Its UX patterns still to be defined.

Six steps. One system.

Research first. Pixel last. Every layer documented in between.

01

Market & competitive analysis

Gemini and NotebookLM — synthesizing the landscape to inform business needs and design decisions.

02

Personas & job stories

User types, roles, needs, goals, and tasks — built from that research.

03

Sector architecture

Screen-by-screen information architecture for each vertical.

04

Platform-specific components

Desktop, mobile, watch — designed separately, not by breakpoint.

05

Tokens & foundations

Color, type, spacing, elevation, motion.

06

Figma ↔ React mirror

1:1 documentation from design to code.

What I designed.

01

Four sector architectures

Commodities, CRE & Alternative Investments, RIA / WealthTech, Prop Desk — full screen-by-screen IA for each.

02

Institutional Five-Pillars framework

Deterministic latency, failure isolation, audit logging — operational-risk requirements translated into UX patterns.

03

Seventy-five-component library

Storybook-style: live demo, HTML / CSS, React usage, props table, and behavior notes for every component.

04

Complete token system

Color, typography, spacing, elevation, motion — WCAG AA built into the foundations.

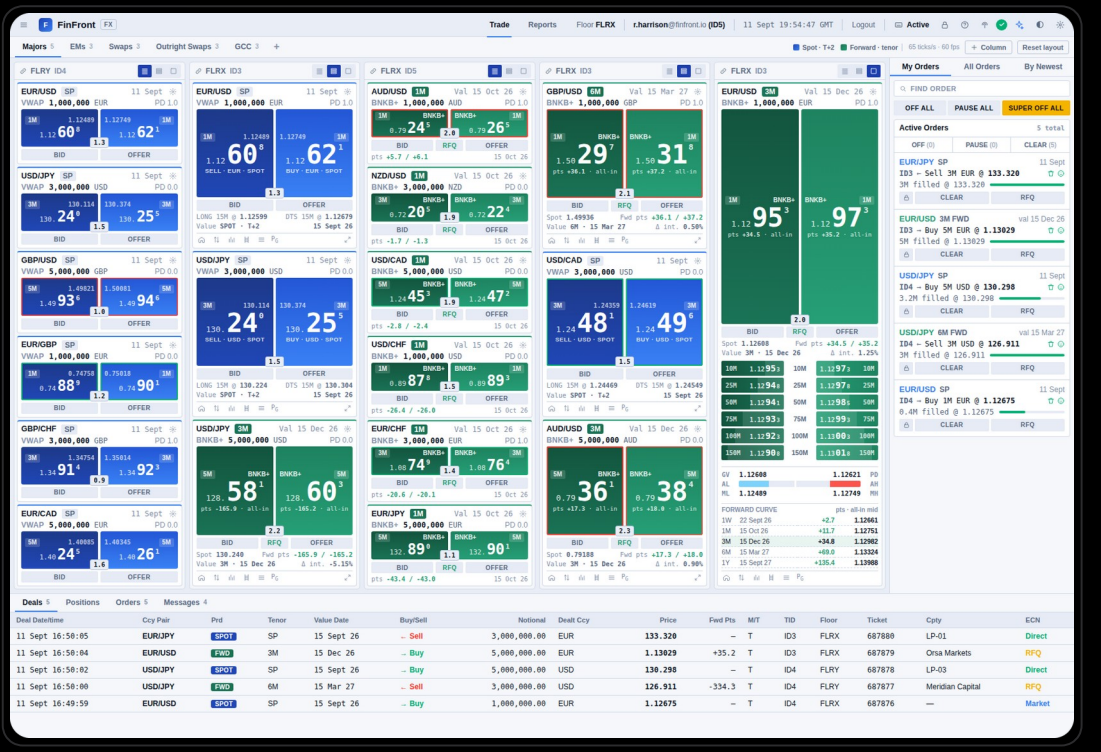

FX Terminal

Multi-pair spot and forwards. Live order management. A deal blotter built for 100+ ticks per second.

DARK MODE

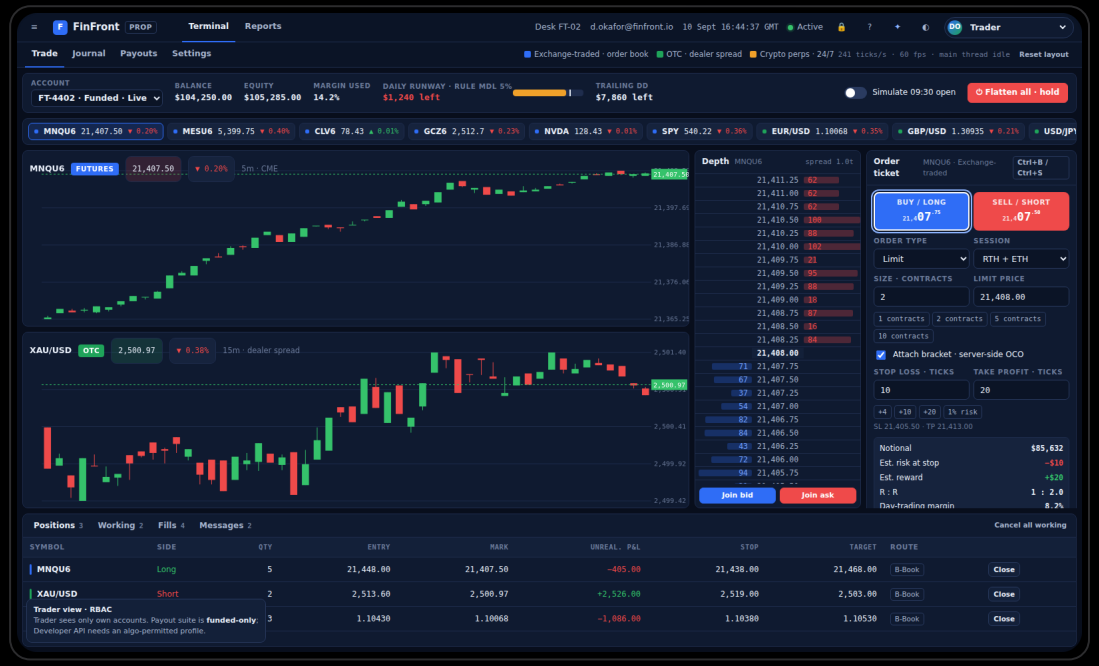

LIGHT MODE

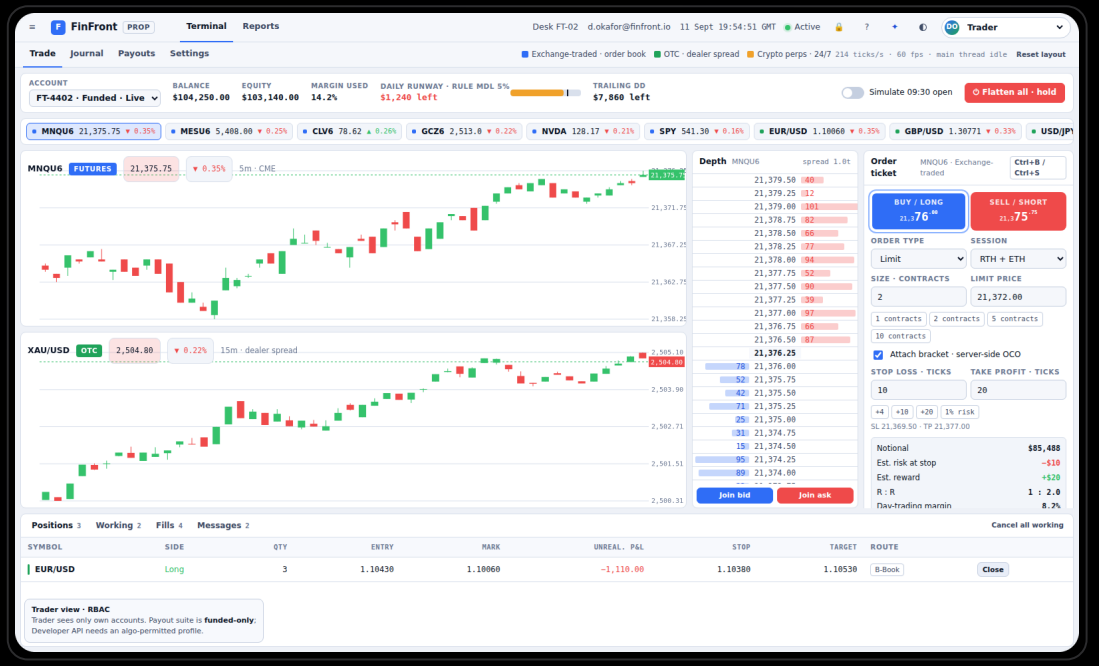

Prop Desk — Trading

Futures and OTC tickets with bracket orders. Live depth. Runway, drawdown, and margin in real time.

DARK MODE

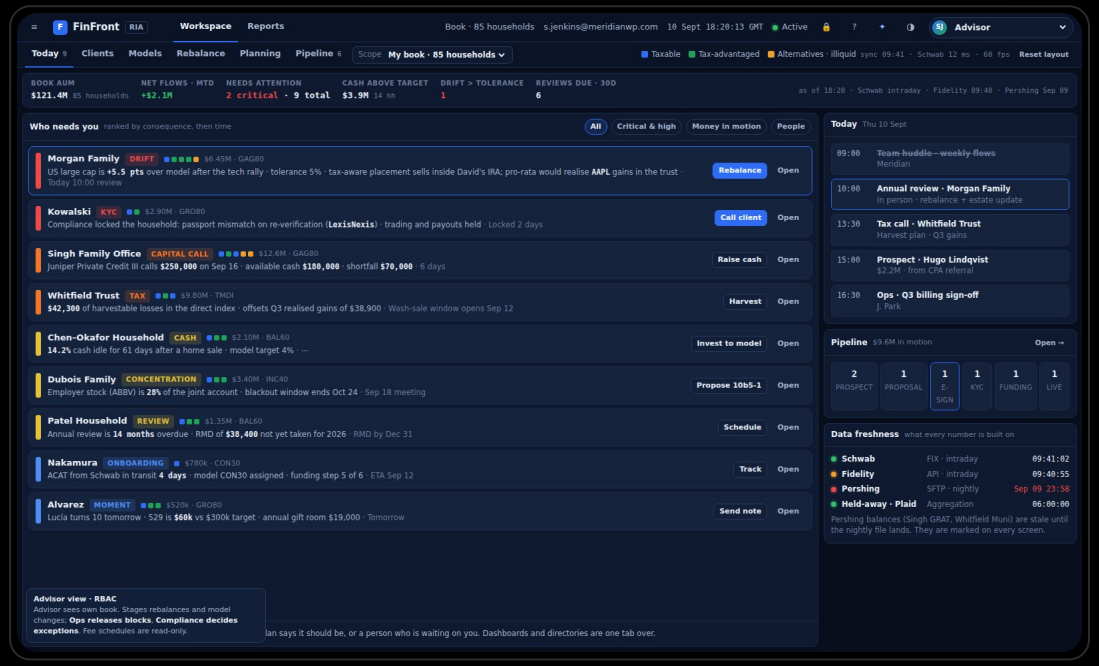

LIGHT MODE

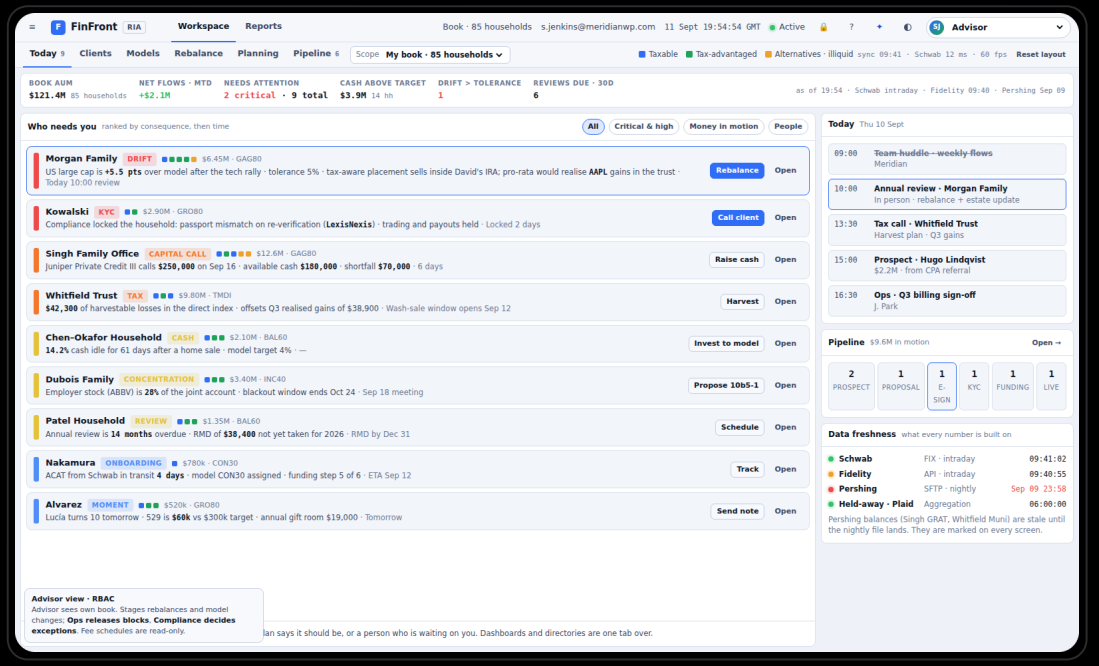

RIA — Advisor Workspace

Eighty-five households, ranked by consequence and time. Not a client list. A queue.

DARK MODE

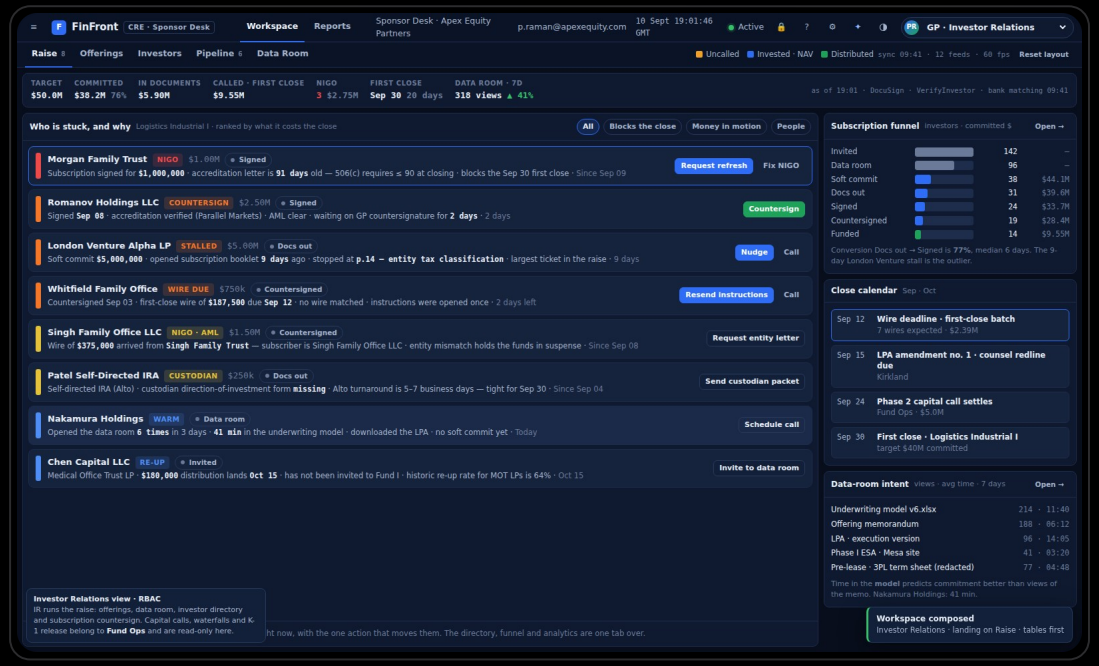

LIGHT MODE

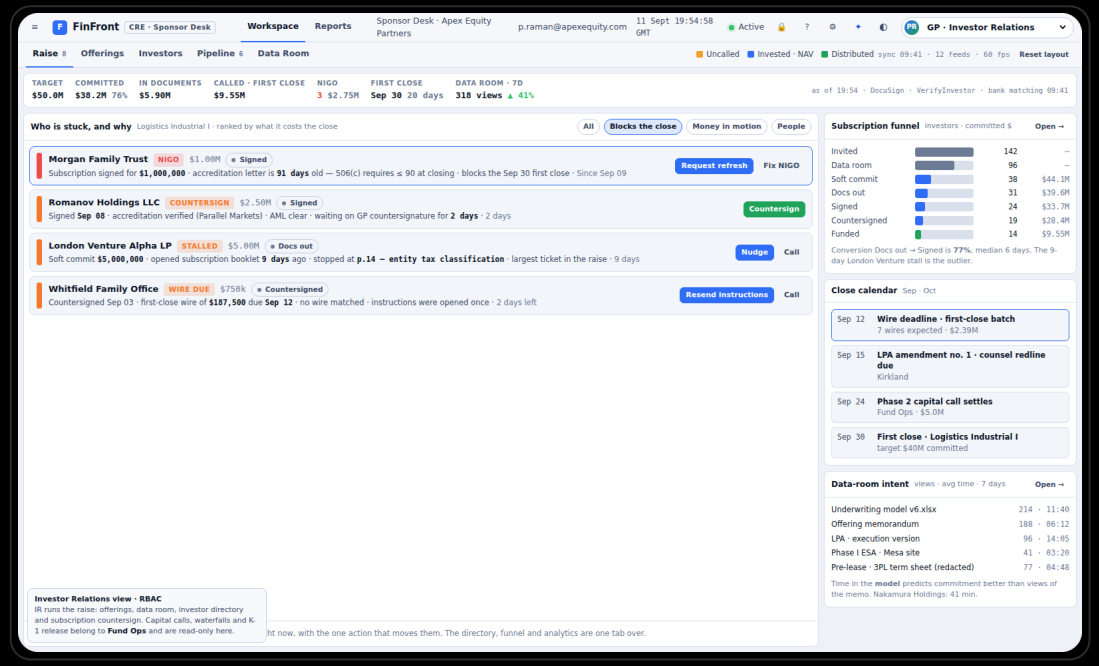

CRE & Alts — Capital Raise

A live raise from the IR seat. Subscription funnel, docs-out status, and what is stalling the close.

DARK MODE

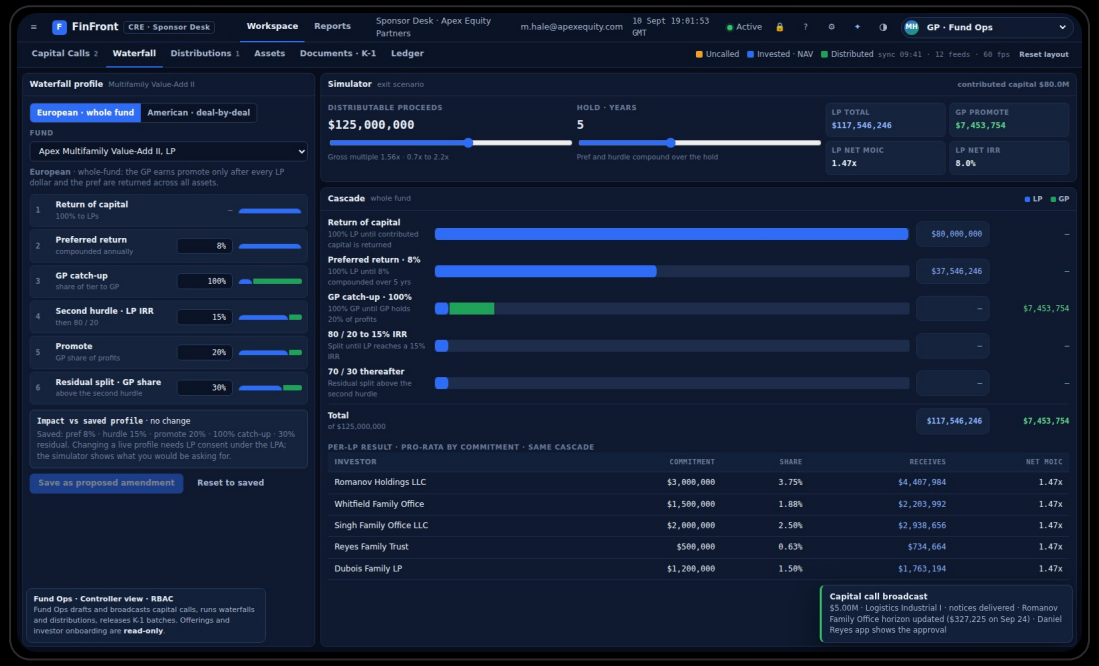

LIGHT MODE

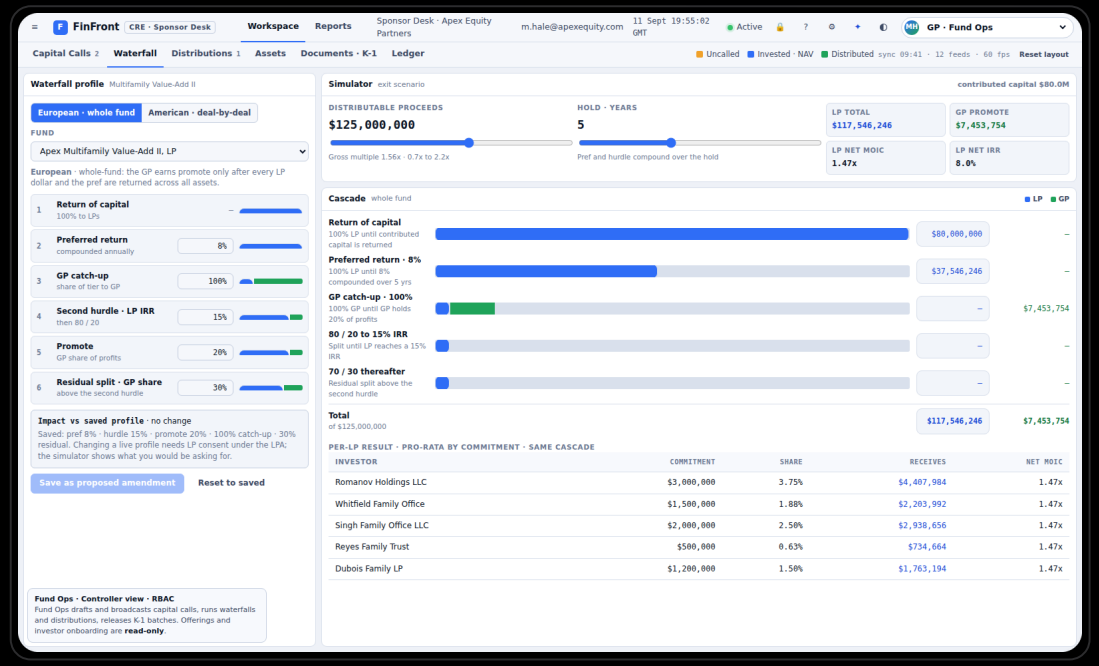

CRE & Alts — Waterfall Visualizer

Preferred return. Catch-up. Promote. A GP / LP distribution waterfall, simulated live.

DARK MODE

LIGHT MODE

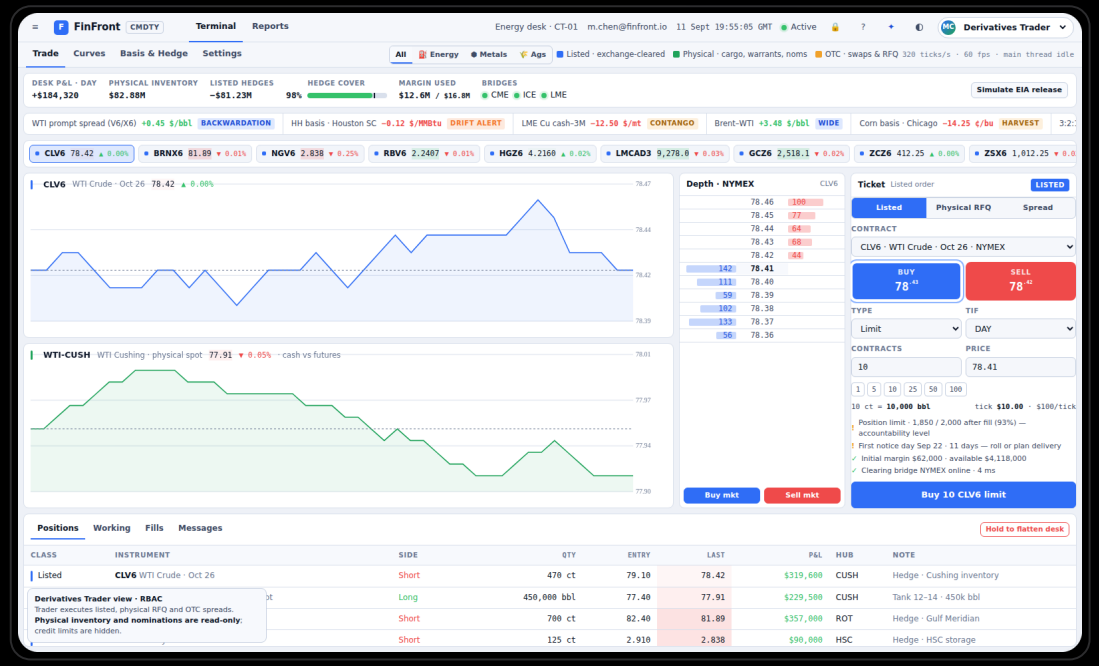

Commodities — Trading Terminal

Listed futures beside physical and OTC pricing. Basis, contango, and hedge coverage at a glance.

DARK MODE

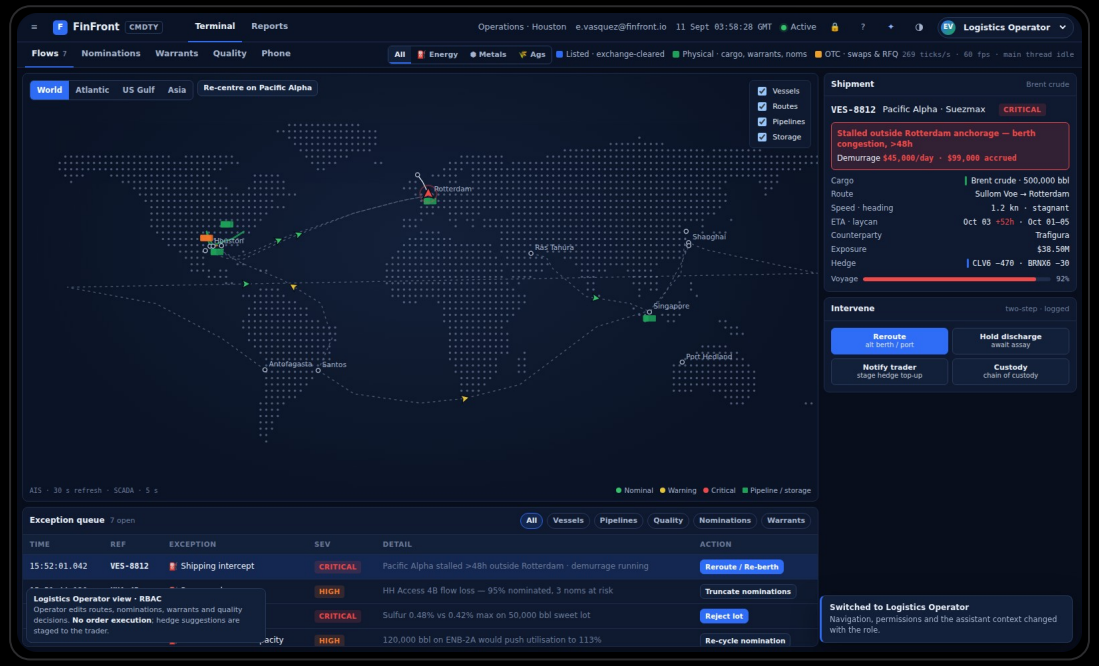

LIGHT MODE

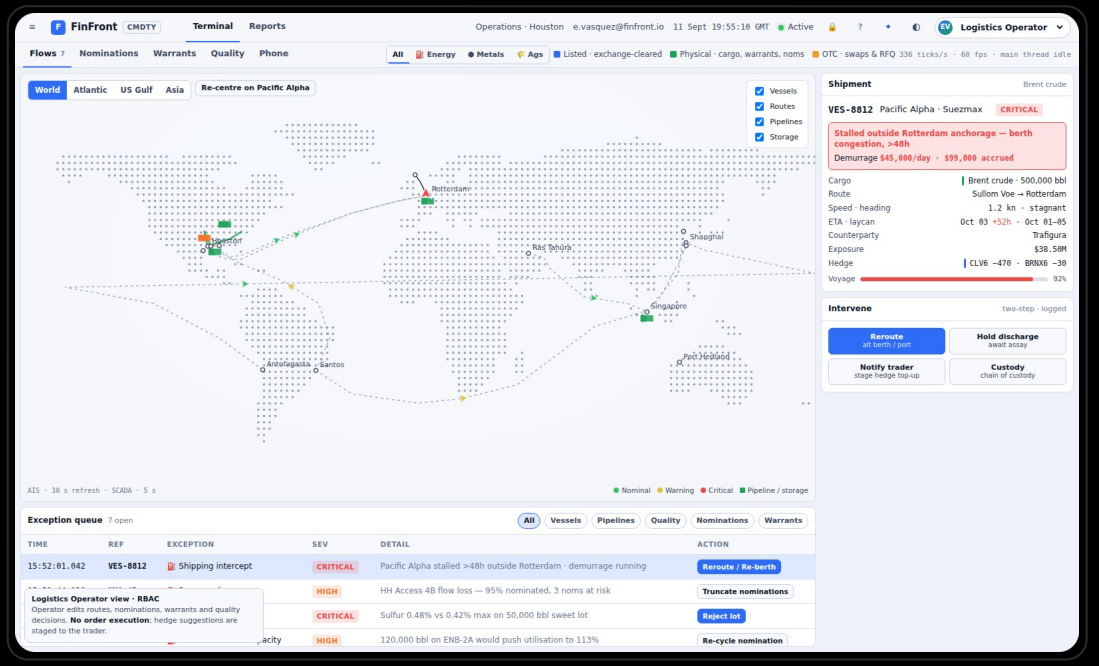

Commodities — Logistics

Vessels, routes, and exceptions on one map. Shipments that need attention, surfaced first.

DARK MODE

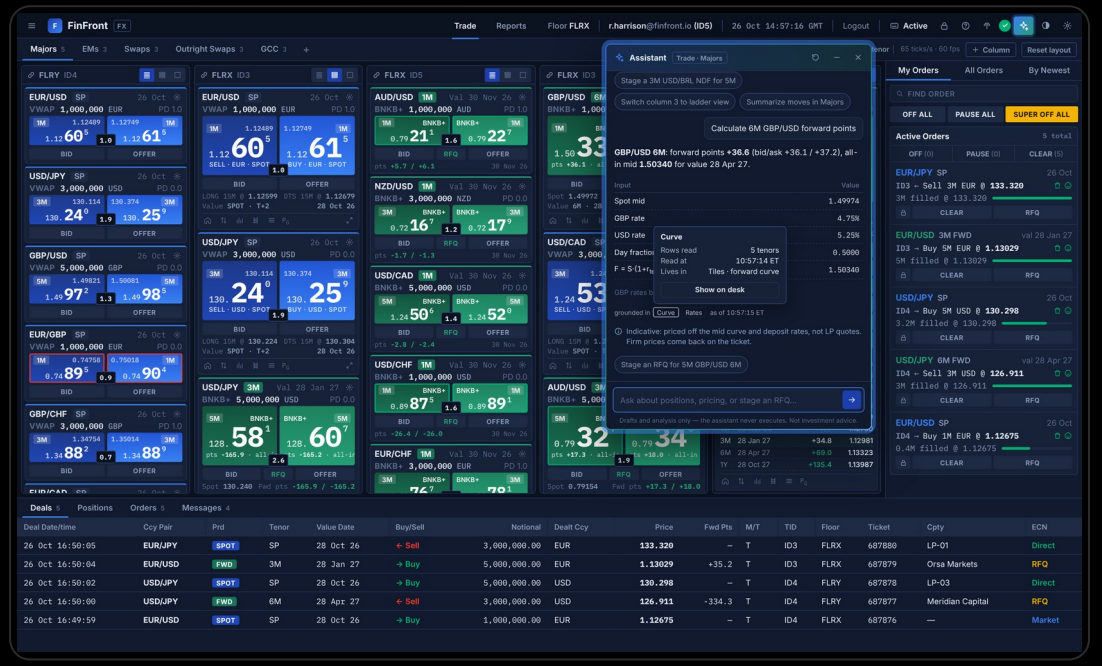

LIGHT MODE

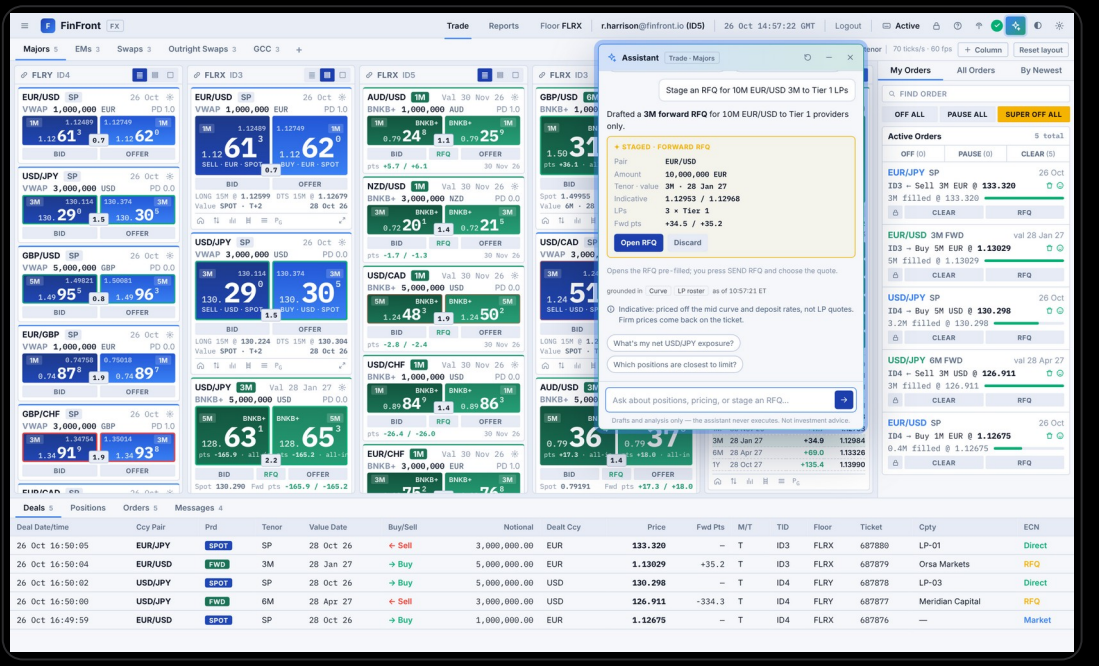

Assistant — Guardrails

One floating assistant on every desk. It cites what it read and when, stops when asked, and stages — never executes.

DARK MODE

LIGHT MODE

Directed by me.
Accelerated by Claude.

WHAT I DIRECTED

01 Market and competitive research, synthesized.

02 Personas, UX strategy, IA — every sector.

03 Visual language, design tokens, layout systems.

04 Component behavior, states, interaction rules.

05 Final review and refinement of every output.

WHERE CLAUDE ACCELERATED ME

01 Fintech requirements, synthesized into docs.

02 React / TypeScript + CSS scaffolding, drafted.

03 The 75-section library, generated.

04 Five verticals iterated in days. Not months.

TOOLS — FIGMA · GEMINI · NOTEBOOKLM · CLAUDE (ANTHROPIC) · REACT 19 · TYPESCRIPT · TAILWIND

Five sectors. Already underway.

FX, Prop, RIA, and CRE & Alts are live. Five more categories — still running on legacy, fragmented tooling — are next.

01 IN DEVELOPMENT

Commodities & Physical Logistics

CTRM's next layer: vessel telemetry, forward-curve engines, physical RFQ tickets.

02 IN DEVELOPMENT

Private Credit & Direct Lending

Loan tapes, off Excel: covenant matrices, amortization waterfalls.

03 IN DEVELOPMENT

Fixed Income, Rates & Derivatives

Beyond Bloomberg: yield-curve mappers, swap builders, compliance blotters.

04 IN DEVELOPMENT

RWA Tokenization & Web3

Tokenized assets, un-designed: on-chain order books, mint/redeem flows, plain-English fee cards.

05 IN DEVELOPMENT

Corporate Treasury & Spend

Real-time treasury: multi-bank liquidity hubs, FX hedging simulators, exception queues.

Four things this project proves.

01

Systems thinking at scale

75 components, 5 verticals, desktop-first — one design language.

02

Complexity, translated into clarity

Regulatory and real-time constraints, turned into interfaces people understand at a glance.

03

End-to-end ownership

Personas to information architecture to tokens to component specs.

04

Fluent in AI-native workflows

Directing AI tools to move faster — without surrendering design judgment or craft.

Intuitive. Visually appealing. Easy to use.

The standard I hold every project to.

Let's talk.

A living project. Still being built.

From persona to pixel to production code — I'd welcome the chance to walk you through the full library and the decisions behind it.
