FINFRONT SDK ASSISTANT

A CASE STUDY IN AI-NATIVE UX

Designing an AI assistant traders can trust.

Six design decisions from a desk assistant that **drafts, cites, and waits** — never blocks a price, never sends an order.

OCTOBER 2026

On a trading desk, an assistant that hides prices or acts alone is a liability.

Most AI assistants are designed for a blank page. A trader's screen is already full, and every number on it is live. The assistant has to earn its place **without covering a price or touching an order.**

The desk doesn't want a chatbot.

It wants a second pair of eyes that answers in its own numbers — and leaves the buttons alone.

So the brief had four parts.

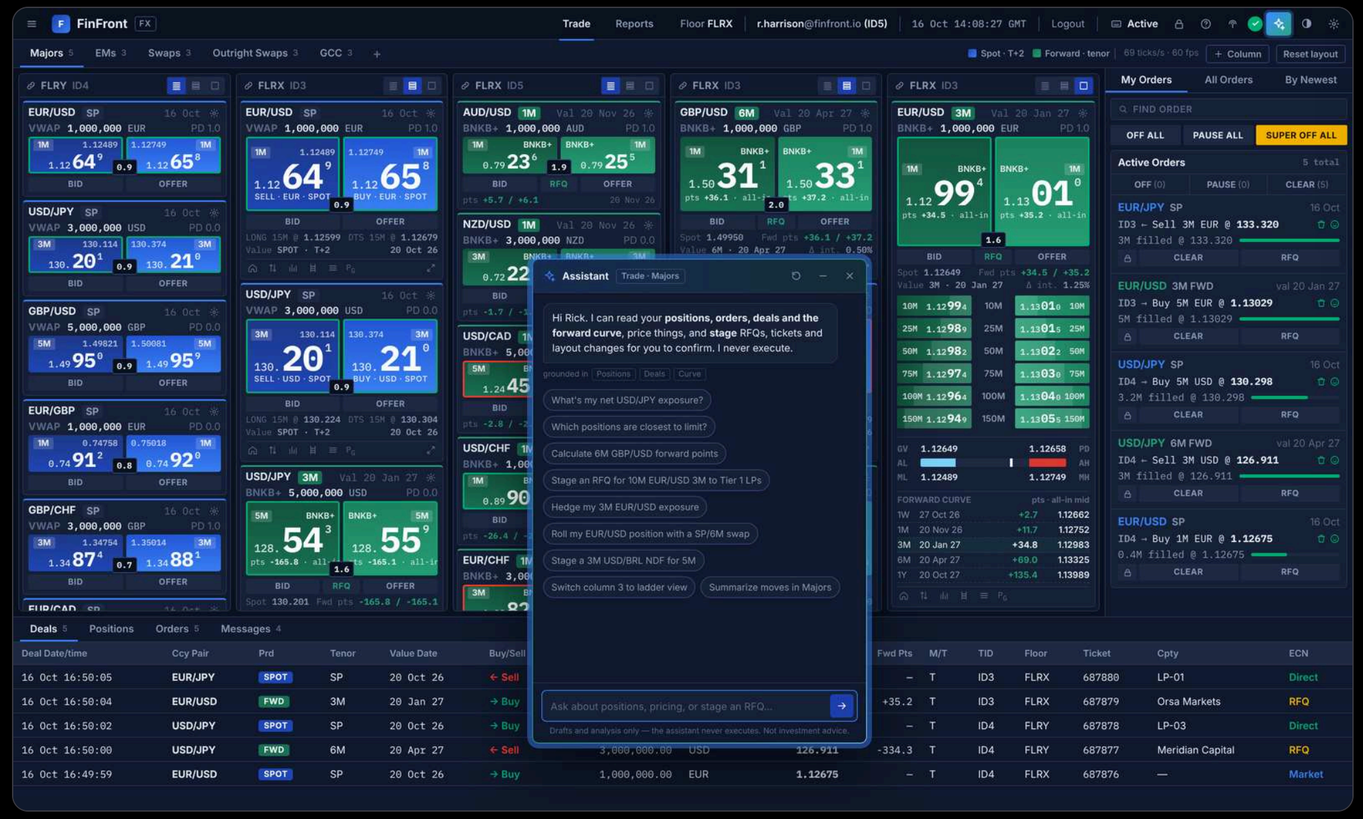

Never block the data. Never execute. Show every source. Only interrupt when there's something new.

READ THIS FIRST

FinFront is a self-directed prototype with synthetic data. There are no usage numbers here — this is a study of design decisions, not results.

Never block the data.

The assistant is a **floating panel**, not a docked column. Drag it over whatever you aren't watching, minimise it to a title bar, or close it. The ladder underneath never loses a column.

PARKED LEFT

DEFAULT · BY THE ORDERS

01 Drag it by the title bar — anywhere on the screen.

02 Minimise to one row; close and reopen with one key.

03 It remembers where you left it, per user.

04 Nothing underneath reflows. No column ever leaves.

FinFront SDK is a self-directed prototype built for portfolio demonstration — not a licensed product. All data shown is synthetic.

Stage, never execute.

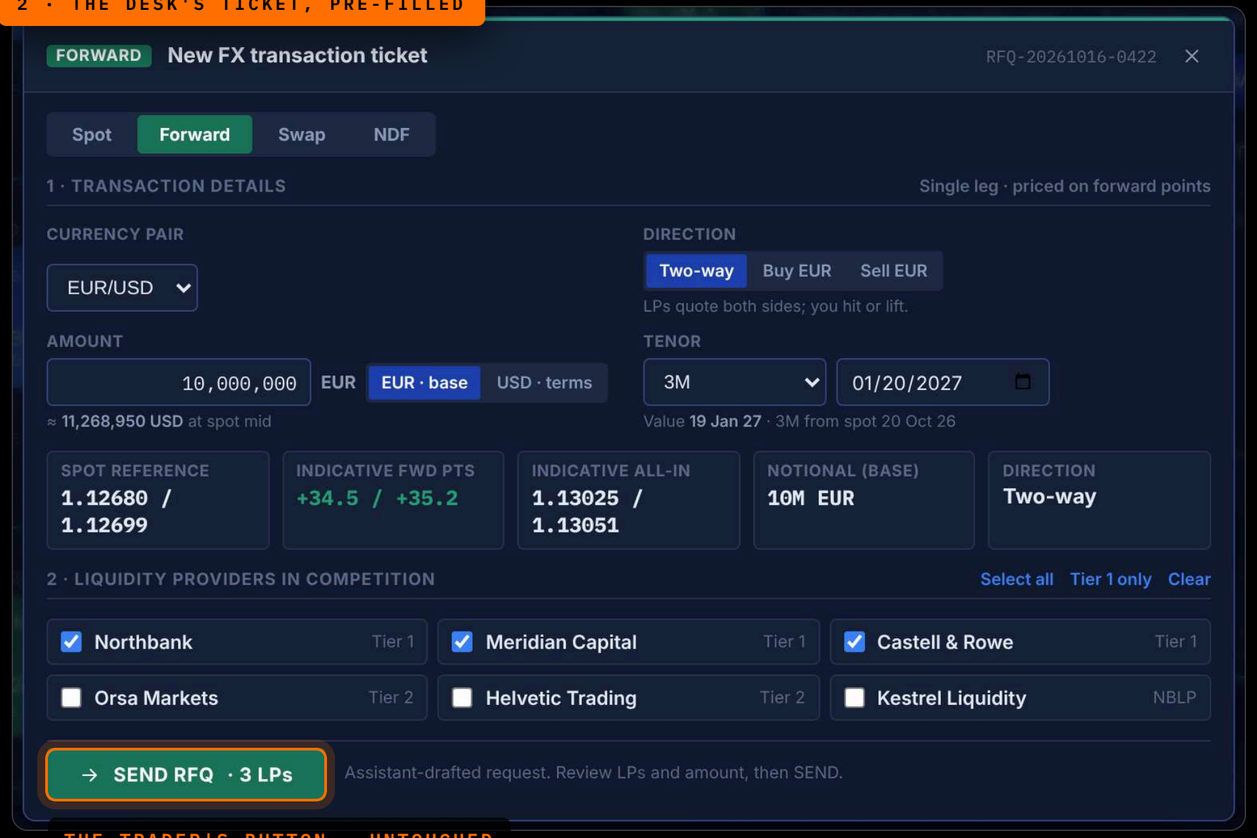

Ask for an RFQ and the assistant **drafts** one — pair, amount, tenor, Tier-1 LPs, indicative points — as a staged card. **Open RFQ** loads the desk's own ticket, pre-filled. SEND stays a human button.

1 · STAGED CARD

OPEN RFQ

2 · THE DESK'S TICKET, PRE-FILLED

THE TRADER'S BUTTON — UNTOUCHED

Panel footer, every screen: “the assistant never executes.”

Show your sources.

Answers come back as **numbers in a table**, computed from the desk's live state — and each one says what it read.

01 **A table, not a paragraph**

Net, limit use and a meter per line — the same units the risk screen uses, so nothing has to be re-read.

02 **“grounded in” — under every answer**

Positions, Deals, Curve, Risk limits: the sources sit where a footnote would.

03 **Every line links back**

Each row carries a *focus* action that jumps to and highlights the tile it came from.

Suggest what fits the screen.

The prompt chips aren't a menu — they follow the **context chip** in the panel header. **Trade · Majors** offers hedges, rolls and RFQs for the pairs on screen; **Reports** offers audit trails and fill rates.

TRADE · MAJORS

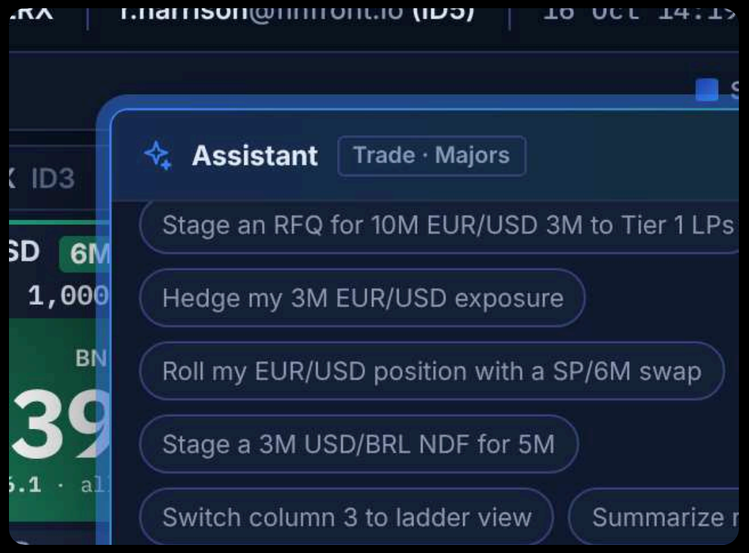

REPORTS

Get noticed only when it matters.

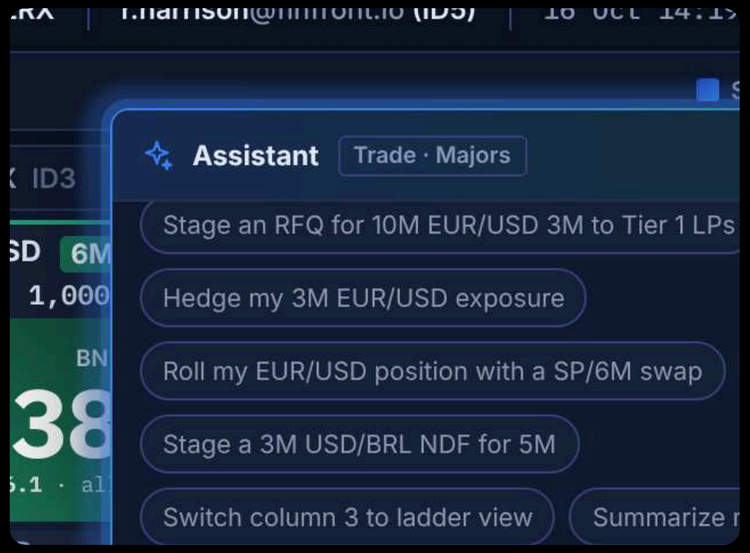

The blue-to-green border **beats** twice on open and once when a reply lands — only if you aren't already looking. Closed, one amber dot on the toolbar holds the unread reply. There is no idle animation.

IDLE · READING

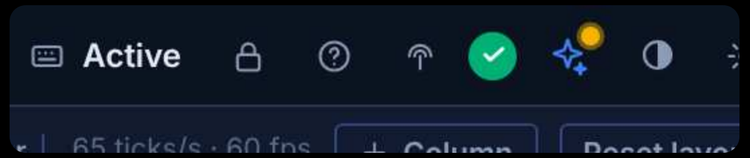

A gradient hairline and a soft halo. Nothing moves while you read.

REPLY LANDS · ONE BEAT

One ring, 0 → 26 px as it fades, 1.2 s, once. Skipped entirely if the panel has focus or the cursor.

CLOSED · REPLY WAITING

One amber dot on the assistant button. Open it and the reply is already there.

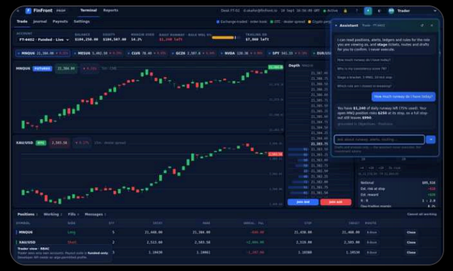

One pattern, five desks.

FX, Prop, RIA, CRE and Commodities share one assistant: same panel, same header and context chip, same first message, same promise. Only what it can **read** and **stage** changes with the desk and your role.

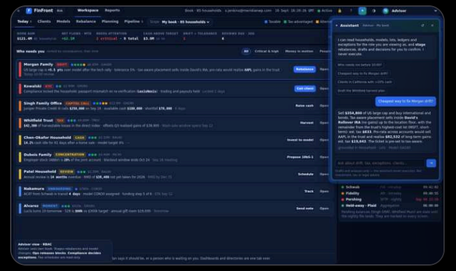

FX TERMINAL

Trade · Majors

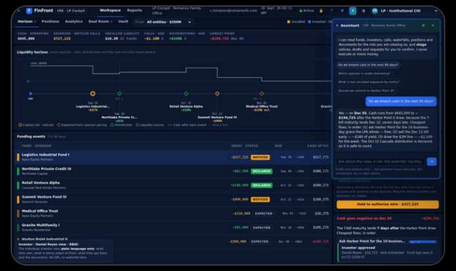

PROP DESK

Trade · FT-4402

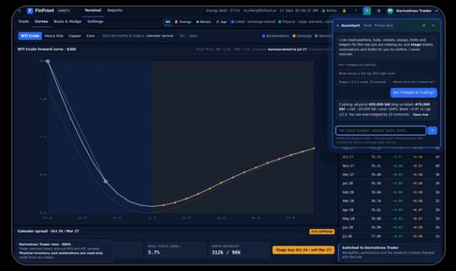

RIA WORKSPACE

Advisor · My book

CRE · LP COCKPIT

CIO · Romanov Family Office

COMMODITIES

Trade · Energy desk

SAME OPENING LINE

“I can read … for the role you are viewing as, and **stage** … for you to confirm. I never execute.”

SAME SCOPE RULE

The role chip in the top bar decides what the assistant can see. Switch roles and its context, chips and permissions switch with it.

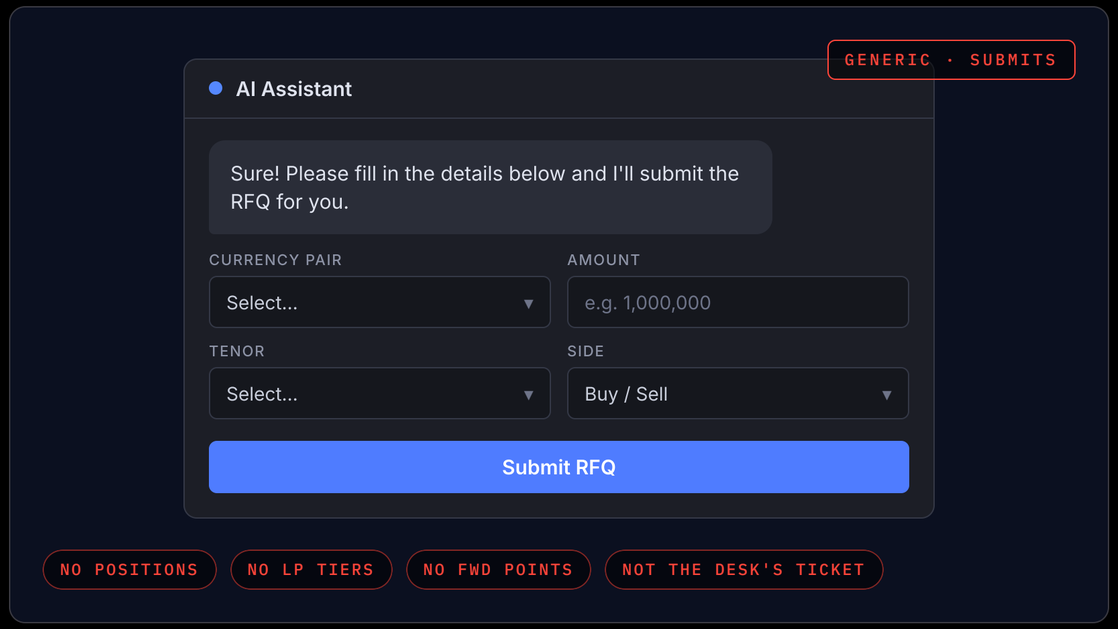

SAME THEME

Dark or light, the panel is drawn from the same tokens as the desk — including the border gradient and the halo.

Where the AI got it wrong.

Asked to “stage an RFQ”, Claude's first pass produced a **generic chat form**: pair, amount, submit. No live positions, no LP tiers, no forward points. The fix wasn't a prompt tweak; it was a rule: **read the live book, draft the desk's own ticket, leave SEND to the trader.**

FIRST DRAFT · REJECTED

Correct, and useless: it knew nothing the desk already knew.

REDIRECTED · SHIPPED

Reads the curve and LP roster, drafts the card, hands off to the real ticket.

Three principles for an assistant on a live screen.

01

Never block the data.

Float, drag, minimise, dismiss. The work underneath is the product; the assistant is a guest on it.

02

Stage, never execute.

Draft into the real ticket and stop. The consequential button belongs to the person who answers for it.

03

Show your sources.

Answer in the desk's own numbers, name what you read, and link every line back to where it lives.
